Practice Task: Club Registration (Form Validation)

Course: CSC 3215 Web Technologies | **Time:** 20 minutes | **Type:** In-class practice (not graded)

Create **one HTML file** named `club.html` with internal CSS and internal JavaScript (a `<style>` tag and a `<script>` tag in the same file). Build a club registration form and validate it step by step. The form is never sent to a server in this task.

Expected result

An invalid entry shows a red message under the form (left). A valid entry shows a green message and the form is cleared (right).

Fields and rules

Field	id	Rule
Full Name	`fname`	Required, at least 3 characters
AIUB ID	`sid`	Required, format `22-12345-1` (2 digits, hyphen, 5 digits, hyphen, 1 digit)
Email	`email`	Required, must be an email address
Age	`age`	Required, between 16 and 60
Password	`pass`	Required, at least 6 characters
Confirm Password	`pass2`	Required, must be the same as Password

Also add a **Register** button, and an empty <p> with the id `msg` below the form. Give the form the id `regForm` and use `action="#"`. Style `msg` as bold with CSS in the `<style>` tag.

Part 1: HTML5 validation (about 5 minutes)

Write the form with all six fields and the Register button. Enforce every rule in the table using HTML5 attributes only (`required`, `minlength`, `pattern`, `min`, `max`, and the right `type`). Do not write any JavaScript yet.

Test: submit the form with a wrong ID such as `abc`. The browser must stop the submission and show its own message.

Part 2: JavaScript validation (about 7 minutes)

The browser's own messages are not under your control. To show your own messages, do the following:

1. Add the attribute `novalidate` to the `<form>` tag. This turns the browser's built-in checks off.
2. Add `onsubmit="return validateForm()"` to the `<form>` tag.
3. Write a function `validateForm()` in your script. Read the name and the ID with `.value`. Use `trim()` on the name.
4. If the name has fewer than 3 characters, show **Name must have at least 3 characters** in red inside the `msg` paragraph (using `innerHTML`) and **return false** so that the form is not submitted.
5. If the ID is not in the format `22-12345-1`, show **ID must be in the format 22-12345-1** in red in the same way and return false. Hint: the ID must have a length of 10, with a hyphen at position 2 and at position 8. You can check these with `length` and `charAt()`.

Part 3: More checks (about 5 minutes)

Add these checks to `validateForm()`, after the checks in Part 2. Each check shows its message in red in `msg` and returns false:

1. Age is not between 16 and 60: **Age must be between 16 and 60**. Convert the age with `Number()` before comparing.
2. Password has fewer than 6 characters: **Password must have at least 6 characters**.
3. Password and Confirm Password are not the same: **Passwords do not match**.

Part 4: Success message (about 3 minutes)

If all the checks pass:

1. Show **Registration successful. Welcome, NAME!** in green inside `msg`, where NAME is the name that was entered.
2. Clear the form.
3. Return false, so that the page does not reload.

Hint: a form element has a method that clears all its fields. Search the web for "how to reset a form using JavaScript".

Check your work

- In Part 1 (before you add `novalidate`), the browser blocks an empty form and a wrong ID.
- Name `Al` shows the name message. ID `2212345-1` shows the ID message.
- Age `70` shows the age message. Password `abc` shows the password message.
- Two different passwords show **Passwords do not match**.
- With valid data (for example `Rahim Uddin`, `22-12345-1`, `r@x.com`, `20`, `abc123`, `abc123`) you see the green welcome message and the form is empty.

Show the finished page to your instructor.
